## WHAT IS A RESCUE SHEET ?

The Rescue Sheet: An emergency data sheet for faster assistance to the occupants.

The ACL-Rescue Sheet can save lives in an accident.

In the event of a serious traffic accident, the rescuers usually have little time to rescue the injured from the cars. For this reason, they need to know certain information about the accident vehicle as soon as possible: Where is the batterie mounted? Where are the airbags located? Where can the vehicle be cut quickly and without risk?

Increasing safety has been a top priority in the planning and development of motor vehicles for many years. However, this also means that the task for the rescuers is becoming more and more complicated. Highly resistant steel and body reinforcements, for example, impair the efficiency of even the most powerful rescue pliers.

A study by the German Automobile Club shows: The younger a vehicle, the longer the time required for rescue. And yet every second counts.

The Rescue Sheet can significantly speed up rescue operations, which can be a decisive factor in life or death for severely injured persons. The rescue card is a DIN A4 sheet that contains all the important data for each vehicle model, enabling the rescue teams to take precise measures for the safe recovery of the injured. Tests have shown that with an existing rescue map, the average rescue time can be reduced to one third.
